New vaccines comprising Sp128 or Sp130 polypeptides, for treating and preventing pneumococcal infections, particularly infections caused by Streptococcus, e.g. otitis media, nasopharyngeal, bronchial, lung or blood infections.

Claim 8; Page 51-54; 54pp; English.

from S. preumoniae. Vaccines comprising the polyperides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus, such as otitis media, nasopharyngeal, bronchial, lung or blood infections. The antigens are used as immunogenic agents to stimulate an immune response. The antisers and antibodies may also be used in diagnosing and treating preumococcal infections. Recombinant polypeptides serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and The invention relates to novel immunogenic polypeptides, Sp128 and Sp130

The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnosts of S. pneumoniae infection, by contacting a sample to be tested with them. Agents capable of anteopositions or interfering with the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the be used to treat S. pneumoniae infection, the elderly, and in patients with predisposing conditions young children, the elderly, and in patients with predisposing conditions such as asplenia, heart, lung and kidney disease, diabetes, alcoholism,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleocides 8-100 of a sequence not defined in the specification, for amplifying a target
                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antiinflammatory; antibacterial; immunostimulant; auditory; respiratory; gene therapy; vaccine.

the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes conding the proteins has been rendered inactive. The proteins, uncleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus nectia, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying timundominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence.

Note: The sequence data for this patent did not form part of the printed a sequence into the printed and particularity in the present sequence. Sequence of the 2469 proteins expressed by the identified coding regions from the genomic sequence.

Solution, but was obtained in electronic format directly from WIPO at ftp, wipo.int/pub/published_pct_sequences. (Updated on 23-OCT-2003 to standardise OS field)

the 613 antisense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibitied by the antisense mucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that inhibits encluded for city parthway in which a proliferation or that has an activity against a biological pathway or equired for proliferation or that the test compound that inhibits spoilferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene or proliferation of an organism. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids are useful for of an organism. The antisense nucleic acids actional dantifying proteins or acreening for homologous nucleic acids required for proliferation in cisolate candidate molecules for rational dantifying proteins or acreening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. arruginosa. The present sequence as encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from William Wi
                          New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of

This invention relates to novel nucleic acids encoding hyperimmune serum reactive antigens, or fragments derived thereof. Specifically, it refers to antigens selected from peptides and serum reactive epitopes that can be used in pharmaceutical compositions that exhibit antibacterial activity. The present invention describes a composition (including the nucleic acid molecule, hyperimmune serum-reactive antigen or antibody) that is useful for manufacturing a acidicament such as a vaccine, which can be used to treat or prevent bacterial infections, particularly S. pneumoniae infections that cause pharyngitis, otitis media, pneumonia, bacteraemia sepais and meningitis. The antigen or its fragment may also be used for isolating, purifying and/ or identifying an interaction partner of the hyperimmune serum reactive antigen, as well as for manufacturing a functional nucleic acid selected from aptemers and relative antigen sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen sequence is a Streptococcus pneumoniae hyperimmune serum reactive antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1953 DIGEVSELKPHRVTVTIQNGKEMSSIIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK 2012

                                                                                                                                                                                                                                                                                                                                                This invention relates to novel isolated Streptococcus pneumoniae nucleic acid molecules and the antigenic polypeptides encoded by them. The invention may be useful for the production of compounds with an antibacterial activity or for gene therapy. The nucleic acid molecules, compositions and methods disclosed are useful for treating Streptococcus pneumoniae infection. The present sequence is that of an S pneumoniae protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Streptococcus pneumoniae e.g. preumonia, bacteraemia, meningitis and otitis media. The present sequence is one of the 2603 disclosed S. pneumoniae protein sequences. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO at seqdata.uspto.gov/sequence.html?DocID=6800744B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid comprising a sequence
                                                                                                                                                                                                                                                 New isolated nucleic acid encoding a Streptococcus pneumoniae polypeptide, useful for diagnosing, preventing and/or treating pathological conditions resulting from the bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Streptococcus pneumoniae

US2005136404-A1.

```
The invention relates to an isolated nucleic acid molecule for detecting, preventing or treating pathological conditions resulting from bacterial confrection. The isolated nucleic acid comprises: (a) any of the 2603 nuclectide sequences of ARA57336 to ARA67918; (b) a nuclectide sequence of ARA57336 to ARA6741; or (c) a nuclectide sequence of at least 8 nucleotides polypeptide comprising any of the cacding a Streptococcus pneumoniae polypeptide comprising any of the nucleotide sequence of at least 8 nucleotides in length, where the sequence is hybridizable to a nucleic acid having any of the nucleotide sequence of a page of a least 8 nucleotides or treating a subject for S. pneumoniae polypeptide, (4) a probe comprising a nucleotide sequence consisting of at least 8 nucleotides of any of ARA57336 to ARA57389; (5) treating a subject for S. pneumoniae polypeptide of a substantially pure preparation of an S. pneumoniae polypeptide of a substantially pure preparation of an S. pneumoniae of polypeptide or its selected from ARA57839 to ARA60441; (7) a vaccine composition for preventing or treating an spenum of a S. pneumoniae of or polypeptide; (9) a computer readable medium having recorded the nucleotide sequences of ARA57389; (10) a computer based system for identifying crapments of the Streptococcus genome of commercial importance. The composition and methods are useful for diagnosing, preventing or treating composition and methods are useful for diagnosing, preventing or treating composition and methods are useful for diagnosing, preventing or treating composition and methods are useful for diagnosing, preventing or treating computer represente a S. pneumoniae of part of the printed specification, but was obtained in electronic format direction, from the negation, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 DAGYVINLSKOTPIKPVPKKIEBKKEBENKPTPDVSKKKONPQVNHSQLNESHRKEDLQR 120

                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated Streptococcus pneumoniae nucleic acids and polypoptides. The nucleic acids and proteins are useful for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, such as S. pneumoniae infection. These may also be used for drug screening procedures. The present sequence represents a Streptococcus pneumoniae polypeptide of the invention. Note: The sequence data for this patent did not appear in the printed specification but was obtained in electronic format directly from USPTO at

Nucleic acid encoding antigenic peptide(s) from Streptococcus pneumoniae - or their epitope-containing fragments, useful in protective or therapeutic vaccines, and for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encoding integration in the present sequence encoding integration is a much in a second in a vaccines for inducing protective antibodies against can be useful in vaccines for inducing protective antibodies against spreptococcus panemoniae, for treatment or prevention of infection e.g. pneumonia, olitis media or meningitis. Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or almplification methods), also for isolating Streptococcus genes or their alleid variants. The protein can be used similarly to detect specific antibodies in standard immunosasays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a protein from Streptococcus pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   KKONPQVNHSQLNESHRKEDLQREHSQKSDSTKDVTATVLDKANISSKSTTNNPNK 117

                                                                                                                                                                                                                                                                                               Streptococcus pneumoniae antigens given in ABP54557 to ABP54669. The S. pneumoniae antigens have antibacterial activity and can be used in actionate antigens antibacterial activity and can be used in attenuate a Streptococcal infection in an animal. The polymucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus mucleic acids. ABQ84905 to ABQ83130 represent primers used in the cloning of S. pneumoniae ORPs (open reading frames) which are used in an example from the present invention
                                                                                                                                                                                                                         New Streptococcus pneumoniae antigens, useful for detecting Streptococcus and for preventing or attenuating disease caused by Streptococcus

Also included are making a recombinant vector by inserting the nucleic acid into a vector, an isolated polymucleotide consisting of at least 50 or 100 contiguous nucleotides of the SP028 nucleic acid, and a recombinant host cell comprising the SP028 polynucleotide. The nucleic acids are useful as DNA vaccine against Streptococcus pneumoniae infection (e.g. pneumonia). Nucleic acids derived from the S. pneumoniae antigen nucleic acids are useful as probes for use in diagnostic methods for detecting S. pneumoniae gene expression. The present sequence represents an S. pneumoniae antigenic protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Staphylococcus epidermidis SR1 strain; infection; diagnosis; vaccination; endocarditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9

                                                                                                                                                                                                                                                                                                                                                  ሯ
                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                                         AAH52104 to AAH51970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81120, from Staphylococcus epidermidis. (I) and have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. c. pidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis AAH33971 to AAH5509 represent appecifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 represent plagonucleotide sequences and primers which are used in the
                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                 exemplification of the present invention. N.B. The present invention specifically claims all the polynucleotide sequences given in the agequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     586 DSVNAQSLKP----ITIGNGKQIKQQSVKSGTKVLPHSKVMLMTDGELTMP-DMTGWTKE 640

frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to acreen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           672

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADS06368
```

```
The invention describes an isolated nucleic acid comprising a nucleotide sequence with any of 3772 fully defined nucleotide sequences (SEQ ID NO: 1-3772) and encoding an Staphylococcus epidermidis polypeptide with any of 3772 fully defined amino acid sequences (SEQ ID NO: 3772-7544) as given in the specification. Also described are: a recombinant expression vector of (1); producing an S. epidermidis polypeptide, an isolated nucleic acid comprising a nucleotide sequence of at least 8 nucleotides in length; a vaccine composition for prevention or treatment of an S. epidermidis infection, comprising a nucleic acid cited above and a carrier; treatment of a subject for S. epidermidis infection, a subject for S. epidermidis infection, a subject for S. epidermidis polypeptide or its fragment; a subject for S. epidermidis infection, a subject for S. epidermidis polypeptide or its fragment; a vaccine composition for prevention or treatment of an S. epidermidis infection; detecting the presence of a Staphylococcus mucleic acid in a sample; a computer readable medium having recorded in it the nucleotide sequence with SEQ ID NO: 1-3772 or its fragments; a computer based system for identifying fragments of the Staphylococcus genome of commercial importance; a computer based system for identifying fragments of the Staphylococcus genome and/or plasmids; and identifying an expression modulating fragment compositions of the present invention are useful for the diagnosis, prevention and/or treatment of an Staphylococcus epidermidis bacterial compositions of the present invention acid sequence of a S. epidermidis bacterial compositions and or infection. This is the amino acid sequence of a S. epidermidis protein of
New isolated polypeptide and encoding nucleic acid derived from Staphylococcus epidermidis, useful for diagnosing, preventing and/or treating an S. epidermidis bacterial infection.
                                                                                                                            Claim 17; SEQ ID NO 5663; 741pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       the invention.

the inventor in transfer to an interest of a cell. Also included are the folla antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated purpleptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular conjiferation or the activity of a gene in an operon required for proliferation, or that they against a biological pathway required for proliferation, or that inhibits ellular proliferation or the biological pathway in which a proliferation, required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation-required gene or the biological pathway in which a proliferation required gene or the biological pathway in which a proliferation or an encound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound's activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the conformance of an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids are quired for collection of for collection of an organism. The antisense nucleic acids are quired for collection of for collection of the definition of an organism. The antisense nucleic acids are quired for collection of the definition of the def
                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a chimeric molecule that comprises a glutamateratic protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite cardidace protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition of a mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive comprising the anti-MSP3 and anti-GLURP cantibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 to the Sequence Listing is not mentioned elsewhere in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   70 KDTFIKPVFKKIEEKKEB------ENKPTFDVSKKKDNPQVNHSQLNESHRKE 116

The present invention relates to the protection against malaria. More particularly, the invention pertains to a family of MSP-3 (merozoite surface protein 3)-like genes (MSP-3-1, MSP-3-2, MSP-3-3, MSP-3-4, MSP-3-5, MSP-3-6, MSP-3-6, MSP-3-6, MSP-3-6, MSP-3-7 and MSP-3-8) located on chromosome 10 of Plasmodium falciparum, highly conserved in P. falciparum strains, simultaneously proteins which have a Asn-Leu-Arg-Asn or Asn-Leu-Arg-Lys signature their N-terminal extremity and which are located at the merozoite their N-terminal extremity and which are located at the merozoite of immunogenic and vaccine compositions against P. falciparum. The present sequence is the P. falciparum MSP-3-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             70 KDTPIKPVFKKIEEKKEE-----ENKPIPDVSKKKDNPQVNHSQLNESHRKE 116

Claim 2; SBQ ID NO 6262; 14pp; English.

The invention relates a recombinant DNA construct comprising a polymucleotide having any of 5544 nucleotide sequences (CDNAs SEO ID NO: 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences (SEQ ID NO: 5455-1108). The cDNAs and proteins are from corn, soybean, arbidopsis, wheat and rape but the specification does not indicate which sequences is derived from which organism. Also included is a method of producing a plant having an improved property, comprising transforming a producing a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising a promoter region that the property is selected from improving plant cold tolerance, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant characteries, for indraving plant tolerance to plant disease, for galactomann production, for production of plant tolerance to plant disease, for galactomann production, for production improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of phonogous recombination in plants, for lignin production, for improving plant tolerance to extreme osmotic conditions, for improving plant colerance to pathogens or pests, for yield improvement by modification of carbohydrate, introgen or phosphorous use and/or uptake and for yield improvement by providing improved plant growth and dor yield improvement by modification of carbohydrate, introgen or phosphorous use and/or uptake and for yield improvement by providing improved plant growth and consecution are useful in the field of biochemistry and genecle a plant transcription affect. The methods and compositions of carbohydrate, increased yield, improved introgen colerance to plant pests or producing transpance) coll to be sequence of the invention. Note: The sequenc

immunotherapy of malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP and MSP3 antigens are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum GLURP(27-500)-MSP3(212-380) fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 15-514) of GLURP (given as SRQ ID No:1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 12-380 of MSP3 (given as SRQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunicated with it. Also described are: (i) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (ii) an immunogenic composition composition to mixture of GLURP and MSP3 antigens as an immunogen, (iii) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (iv) use of purified and/or crecombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive

The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polymucleotide sequence encoding the GLURP-MSP3 fusion protein. The polymucleotide sequence is also useful in preparing a vaccine. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a fusion protein comprising Plasmodium falciparum glutamate-rich protein (GLURP) coupled to P. falciparum merozoite surface protein 3 (MSP3). The GLURP-MSP3 fusion protein is useful as an antigen based vaccine against malaria. Also disclosed is the polynucleotide sequence encoding the GLURP-MSP3 fusion protein. The polynucleotide sequence is also useful in preparing a vaccine. The vaccine is useful in treating and preventing malaria and for inducing an

merozoite surface protein 3; malarial vaccine; malaria; immune response;
antimalarial; immunostimulant.
vaccine is useful in treating and preventing malaria and for inducing immune response against malaria. The present sequence represents P. falciparum GLURP-MSP3 hybrid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encodium (I) and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification
                                                                                                                                                                                                                                                                                              485
                                                                                                                                                                                                                                                                                                                                                                                                    544

of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the Plasmodium chromosome 2 and the subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and provide new targets for vaccine and drug development. Parasite resistance to drugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
```

The present invention relates to a method for identifying candidate proteins in pathogens useful as anti-infectives. The invention discloses a computational method which involves the calculation of several sequence

```
10;
attributes and their subsequence analysis results in the identification of outlier proteins in different pathogens. The method is useful for the identification of outlier proceins (-g. virulence proteins, antigens or proteins used as drug targets) in pathogenic organisms. The method of the invention provides reproducible results as it does not depend on the variable biochemical characterisation of proteins. ABO23500-ABO233617 represent outlier proteins identified from different pathogenic organisms
                                                                                                                                                                                                                                                                                                            The invention relates to a chimeric molecule that comprises a glutamaterich protein (GLURP) moiety consisting of a polypeptide fragment (amino acid residues 25-514) of GLURP (given as SEQ ID No:1) and a Merozoite surface protein 3 (MSP3) moiety consisting of amino acid residues 212-380 of MSP3 (given as SEQ ID No:2), wherein the chimeric molecule raises antibodies against both polypeptides in mice immunized with it. Also
                                                                                                                                                                                                                                                                                                                                                                58 GKKDAGYVINLSKDTFIKPVPKKIEEKKE-----EENKPTFD----VSKKKDNPQ 103

described are: (1) a conjugate comprising the chimeric molecule of the invention bound to a solid support, (11) an immunogenic composition comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, (111) a vaccine against malaria comprising the chimeric molecule, the conjugate described above, or a mixture of GLURP and MSP3 antigens as an immunogen, in association with a suitable vehicle, (1v) use of purified and/or recombinant anti-MSP3 and anti-GLURP antibodies, for the preparation of a medicament against malaria, and (v) a medicament for passive immunocherapy of malaria, comprising the anti-MSP3 and anti-GLURP antibodies. The chimeric molecule of the invention or a mixture of GLURP antibodies are useful for the preparation of a vaccine composition against malaria. This sequence represents Plasmodium falciparum MSP3 protein (amino acid residues 212-380).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 52942; 1766pp; English

```
the nucleic acid inhibits proliferation of a cell. Also included are:

the folls antisense sequences given in the specification where expression

of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid

encoding a polypeptide whose expression is inhibited by the antisense

nucleic acid; (2) a host cell containing the vector; (3) an isolated

contisense nucleic acid; (4) an antibody capable of specifically binding

the polypeptide or its fragment whose expression is inhibited by the

antisense nucleic acid; (4) an antibody capable of specifically binding

the polypeptide (5) producing the polypeptide; (6) inhibiting cellular

contributed for proliferation, or that has an activity against a biological pathway

required for proliferation, or that inhibits cellular proliferation; (8)

identifying a gene required for cellular proliferation of the pathway in which a proliferation required gene or its gene product lies

congound: sactivity; (1) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains in which the gene

crompound: sactivity; (11) a culture comprising strains; or collection of an organism. The antisense nucleic acids required

crompound: soroteins or screening for homologous nucleic acids required

crompound: soroteins or screening for homologous nucleic acids are useful for

crompicated for proliferation to isolate candidate molecules for rational

crompicated for proliferation in the present sequence data for this

crompicatio

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                           The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA abgrance (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

the coll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a productor operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense collypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated of polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibited by the cartisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting callular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation or that inhibits callular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or product is averances or underexpressed; (12) determining the extent compound; or the strains is present in a culture or collection of an organism; or (13) identifying the target of a compound that inhibits the compound or an organism. The antisense nucleic acids are useful for dentifying proteins or screening for homologous nucleic acids required for for encounter or proliferation of an organism and the promoted acids are useful for dear or provery procrams or for sevening and promoted acids required for the strains and the promoted acids are useful for contrains and promoted acids are useful for the dear or the sevening accompand that inhibits and accounted and accounted and accounted and accounted and accounted and accounted accounted and accounted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ę,
                                                                                                                                                                New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent din not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             240 ELSEVNEHRKVIEKELNEKEROKNVVEKKOBDINKEVEVLODVIEKSVDYIN-SIKGVIS 298

falciparum (malaria parasities an isolated anti-out full from a falciparum (malaria parasities) antigen polymucleotide sequence, encoding an immunogenic peptide. Also described: (1) a primer or detection probe (CC for hybridisation with a target sequence or the amplicon generated from a target sequence comprising a sequence of at least 8-30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80, 85, 90, 95 or 100 consecutive nucleotides of any of the polymucleotide sequences as described above; (2) a UNA chip comprising any of the polymucleotide sequences described above; (3) a composition of the polymucleotide described above; (5) a composition of comprising a promoter operably linked to any of the nucleic acid sequences described above; (6) a method of inducing a rarrier and the polymucleotide described above; (6) a method of inducing an immune response in an individual comprising the administration of the composition of (5) to induce an immune response; (7) an isolated composition of (5) to induce an immune response; (7) an isolated composition of (5) to induce an immune response; (7) an isolated composition of (5) (9) a method of detecting P. falciparum in belongical samples, comprising contacting a biological sample with the composition of a composition of an immune response in an individual, comprising the isolated composition of a composition of action composition of an individual, comprising the individual; (11) an antibody that specifically binds to the P. falciparum polypeptide of (7); candidation of action of a composition of a com
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic, anti-HIV, virucide, hepatotropic and antibacterial activities, and can be used in vaccines. The methods and compositions of the present invention are useful for inducing an immune response for the prevention and/or treatment of cancer and infectious diseases, such as AIDS, hepatitis and bacterial infections. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 represents a P. falciparum antigen amino acid sequence, which is used in the exemplification of the present invention.
Plasmodium falciparum; malaria parasite; antigen; malaria; immunogenic; immune response; cytostatic; anti-HIV; virucide; hepatotropic; antibacterial; vaccine; cancer; infectious disease; AIDS; hepatitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences, useful in inducing an immune response for preventing and/or treating cancer and infectious diseases, such as AIDS, hepatitis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention describes an isolated and/or purified Plasmodium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated and/or purified Plasmodium falciparum polynucleotide

The vWb and immunogens of vwb are useful in vaccines to combat infections caused by Staphylococci. The invention is also useful for detection of staphylococcal infection and purifying von Willebrand factor from a complex solution. The present sequence is Staphylococcus lugdunensis vWbl protein

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88447 that comprise a modified saureus ORF0657n sequence ADW88439-ADW88443 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to betteet the presence of S. aureus, and being used to generate

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. C Also described are: (I) nucleotide sequences (II) encoding (I); and (2) c vaccines against P. falciparum infection comprising (I) or (II). (I) and polyclonal antisers or a monoclonal antibody raised to infection. (I) and polyclonal antisers or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they can immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they can exerceted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum. Sequencing of the confound thromsome 2 and the subsequent identification of proteins canceded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and confounds and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. The infention relates to a movel isolated muches and molecule encoding a fibrinogen-binding polypeptide or its fragment, or an adhesion factor or its fragment. The invention further comprises: a vector comprising the above mucleic acid molecule; a cell, preferably a heat cell, comprising the vector; a polypeptide, preferably a fibrinogen-binding polypeptide or an adhesion factor, comprising an amino acid sequence encoded by the above mucleic acid molecule; a process for producing the above polypeptide or its fragment; a producing the above polypeptide or its fragment; a pharmaceutical composition, expresses the polypeptide or its fragment; a pharmaceutical composition, above nucleic acid molecule; an antibody, or its part, that binds to at least a selective part of the polypeptide or its fragment; methods for identifying an antagonist capable of reducing or inhibiting the activity of the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the polypeptide or its fragment, capable of binding to the activity of the polypeptide or its fragment, or its interaction partner; an antagonist identified by the above method; processes for in vitro an antagonist identified by the above method; processes for in vitro diagnosis of a bacterial infection, preferably Streptococcus agalactiae configuration or a disease related to the expression of the above polypeptide or its fragment; and an affinity device comprising a support material and immobilized to the support material the above polypeptide or the support material the above polypeptide or the support material the above polypeptide.

nucleic acid molecule. The fibrinogen-binding polypeptide has
antibacterial activity. The nucleic acids may be used in gene therapy to
treat disorders. The nucleic acids acid is used for manufacturing or generating
functional ribonucleic acids selected from ribozymes, antisense nucleic
acids and siRNA. The polypeptide or its fragment is useful for
manufacturing a medicament, especially a vaccine against bacterial
infection. The polypeptide is also used for manufacturing an antibody
that may be used for manufacturing a medicament for treating or
preventing bacterial infections, especially S. agalactiae infections. The
polypeptide is also used as an antigen, or for isolating, purifying
and/or identifying an interaction partner of the polypeptide or its
fragment, or for generating a peptide binding to the polypeptide, such as
anticalines. It may also be used for manufacturing or generating a
cunticalines in the may also be used for manufacturing or generating a
cfunctional nucleic acid selected from aptemers and spiegelmers. This
sequence represents a fibrinogen-binding polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         372
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides, replication, ransacribiton, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposoms, biosynthesis of cofactors, prosethetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the detection and/or amplification of suseful for treatment of a bacterial S. agalactiae infection. The complete genome of Streptococcus agalactiae is given in ADV81204. Note: The present patent is an equivalent for the basic patent FR2824074Al, which contains only 2344 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                          NLSKOTPIKPVPKKIEEKKEEENKPTPDVSKKKONPQVNHSQLNESHRKEDLQREEHS-- 124

ADV87746-ADV89950). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleotide metabolism including purines, pyrimidines and/or nucleotide metabolism including purines, pyrimidines and/or nucleotide metabolism including purines, pyrimidines and/or malaporet and proteins replaced conditions, sensitivity to medicines and/or analogues, functions related conditions, blosynthesis of cofactors, prostbetic groups and cranspoorers, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for the abacterial S. agalactiae infection. Note: WO200292818A2 is equivalent for the present basic patent FR2824074A1. WO200292818A2 contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                      7;

novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism, tatty acid and phospholipid metabolism, nucleotide metabolism, including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of a bacterial S. agalactise infection. The complete genome of Streptococcus agalactise is given in ADV81204. Note: The present patent is an equivalent for the basic patent FR2824074A1, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              124

immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88433-ADW88438 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and ORF0190. They were designed by taking into account the similarity and differences between native ORF0657n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to detect the presence of S. aureus, and being used to generate antibodies to therapeutic antibodies for aureus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            : | : : : | : | | | | | 466 EQQDNSAKKEATPATPSKPTESPVEKESQKQDSQKDDNKQLPSVEKENDASSESGKDKTP 525

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence ADW88439-ADW88474 that comprise a modified S. aureus ORF0657n sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0577 and differences between native ORF0557n and ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and a method for evaluating the ability of an immunogen to produce a protein expense against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to therapeutic antibodies that target S. aureus.

The present sequence is that of a Staphylococcus aureus protein ORF0657n hybrid polypeptide. This is an example of claimed hybrid polypeptide immunogens of the invention ADW88439-ADW88444 that comprise a modified S. aureus ORF0657n sequence ADW88443-ADW88443 containing amino acid substitutions that increase sequence similarity to ORF0190 ADW88432. The hybrid polypeptides contain one or more epitopes for ORF0657n and CAF0190. They were designed by taking into account the similarity and differences between native ORF0190 protein sequences. The invention also provides nucleic acids encoding these hybrid polypeptides, and amethod for evaluating the ability of an immunogen to produce a protective immune response against Staphylococcus infection using an animal (mouse or rat) model. The hybrid polypeptides having therapeutic and diagnostic applications, such as being used to provide protective immunity against S. aureus infection, being used to generate antibodies to therapeutic antibodies that target S. aureus.
